

# CORPORATE ATTRITION PREVENTION: STRATEGIC ACTION PLAN

## 1. Executive Summary & Financial Imperative

An end-to-end Machine Learning and Business Intelligence audit was conducted on 10,000 employee records. The data proves that attrition is not random. Resignations are heavily concentrated in cohorts experiencing extreme burnout, rigid remote-work policies, and toxic management. The Estimated Cost of Turnover (ECOT)—calculated at 20% of an exiting employee's salary—currently threatens millions in bottom-line revenue.

## 2. Management Rehabilitation (The Burnout Matrix)

The SHAP analysis highlights the deadliest combination for corporate retention: High monthly overtime combined with a Manager Satisfaction score of 1 or 2.

- **Actionable Strategy:** Implement automated HR alerts within the Power BI dashboard. If an employee logs >25 hours of overtime in consecutive months, trigger a mandatory, confidential HR check-in that bypasses their direct manager. Managers with consistently low team-satisfaction scores must be structurally reassigned.

## 3. Remote Work Policy Restructuring

The predictive model identified the "Never Remote" variable as a statistically significant driver of attrition, particularly within the Engineering and Marketing departments.

- **Actionable Strategy:** Abandon rigid return-to-office mandates. The data supports transitioning to a fluid

"Hybrid" model for non-hardware-dependent roles. The ECOT savings recognized by retaining just three Senior Engineers will completely offset the logistical costs of expanding hybrid IT infrastructure.

#### 4. Career Pathing & The 3-Year Threshold

The EDA and algorithm recognized a severe spike in attrition probability for employees who cross the 3-year tenure mark without receiving a formal promotion.

- **Actionable Strategy:** Overhaul the internal mobility framework. Establish a "Micro-Promotion" system (e.g., transitioning an "Engineer I" to "Engineer II" with minor compensation bumps at the 18-to-24 month mark). This disrupts the algorithmic attrition trigger and re-engages the employee lifecycle before they enter the "High Risk" flight tier.

## **5. Targeted Intervention (Using Power BI)**

Blanket retention bonuses are financially inefficient. HR leadership must utilize the deployed Power BI dashboard to actively filter for the "High Risk" tier. Retention capital should be aggressively and exclusively deployed to save highly rated individuals within this specific, AI-identified cohort.
